

**Math 1650 Precalculus**  
**Section 100**

**Class:** MW 9:00 - 10:20    General Academic Building (GAB) 104

**Recitation sections:**

- 101: TR 8:00-8:50am Language (LANG) 113
- 102: no longer exists (folded into 101)
- 103: TR 9:30-10:20am Language (LANG) 209
- 104: no longer exists (folded into 103)

Recitation instructor: Jerry Day

**Instructor:** Mark Brittenham

**Office:** General Academic Building (GAB) 405 (formerly 407)

**Telephone:** (565)-2974

**E-mail:** britten@unt.edu

**WWW:** <http://www.math.unt.edu/~britten>

**WWW pages for this class:** <http://www.math.unt.edu/~britten/classwk/1650f98/>

**Office Hours:** (tentatively) Mo 11:00-12:00, Tu 2:00 - 3:00, We 12:30-1:30, and Th 1:00 - 2:00, and whenever you can find me in my office and I'm not horrendously busy. You are also quite welcome to make an appointment for any other time; this is easiest to arrange just before or after class.

**Text:** *Precalculus*, by Larson and Hostetler (4th edition).

This course, as the name is intended to imply, will provide you with (nearly) all of the tools needed to make a successful attack on the calculus. We will make a good stab at covering the entire book during the semester. In particular, we will cover the following sections of the text ( although not necessarily in this order):

- Ch. 1, Functions and Their Graphs: sections 1.1 thru 1.6
- Ch. 2, Polynomials and Rational Functions: sections 2.1 thru 2.7
- Ch. 3, Exponential and Logarithmic Functions: sections 3.1 thru 3.4
- Ch. 4, Trigonometry: sections 4.1 thru 4.7
- Ch. 5, Analytic Trigonometry: sections 5.1 thru 5.5
- Ch. 6, Additional Topics in Trigonometry: sections 6.1, 6.2, and 6.5
- Ch. 9, Sequences and Probability: sections 9.1 thru 9.4
- Ch. 10, Topics in Analytic Geometry: sections 10.1 thru 10.4

Other topics will be included as time allows.

**Homework** will be assigned from each section, as we finish it. It is an essential ingredient to the course - as with almost all of mathematics, we learn best by doing (again and again and ...). Cooperation with other students on these assignments is acceptable, and even encouraged. However, you must write up solutions on your own - after all, you get to bring only one brain to exams (and it can't be someone else's). For the same reason, I also recommend that you try working each problem on your own, first. Assignments will be due in recitation two class periods after it is assigned (i.e., Mo assignments are due on Th, We assignments are due the following Tu). Some fraction of the problems will be graded; these problems will be specially marked on the assignment. But you are strongly encouraged to work all of the problems; practice really does make perfect(or a close approximation to it)!

Homeworks handed in late will be recorded as turned in but not graded. Homework will count 15% toward your grade.

**Midterm exams** will be given three times during the semester, during the recitation sections - the specific dates will be announced in class well in advance of each exam. Each exam will count 20% toward your grade. You can take a make-up exam only if there are compelling reasons (a doctor SAYS you were sick, jury duty, etc.) for you to miss an exam. Make-up exams tend to be harder than the originals (because make-up exams are harder to write!).

Finally, there will be a regularly scheduled **final exam** on Monday, December 14, from 8:00am to 10:00am. (Note that since this class covers two traditional MWF time periods, there were two choices for the exam time; the other one was Friday at 8am.) It will cover the entire course, with a slight emphasis on material covered after the last midterm exam. It will count the remaining 25% toward your grade.

**Your course grade** will be calculated numerically using the above scales, and will be converted to a letter grade based partly on the overall average of the class. However, a score of 90% or better will guarantee some kind of an **A**, 80% or better some sort of **B**, 70% or better a flavor of **C**, and 60% or better a **D**.

In mathematics, new concepts continually rely upon the mastery of old ones; it is therefore essential that you thoroughly understand each new topic before moving on. Our classes are an important opportunity for you to ask questions; to make sure that you are understanding concepts correctly. Speak up! It's your education at stake. Make every effort to resist the temptation to put off work, to fall behind. Every topic has to be gotten through, not around. And it's alot easier to read 100 pages in a week than it is in a day. Try to do some mathematics every single day. **Class attendance** is probably your best way to insure that you will keep up with the material, and make sure that you understand all of the concepts. I will not be taking attendance; I expect that you will simply see the wisdom of attending class, for yourselves.

**Calculators** are terrific devices for finding (approximate) numerical answers. However, the goal of this course is to teach you how to find the answers, not to actually get the answers. (If that makes sense...) And the numbers we will typically be tossing around will be simple enough that using a calculator would just get in the way. Consequently, you are requested not to use them, except perhaps as a way to verify the correctness of your work. Get used to not using them, however, because they will be specifically banned from most of our exams.

**Note:** In accordance with UNT policies, it is the responsibility of students with certified disabilities to provide the instructor with appropriate documentation from the Dean of Students Office.
