Math 208H

Why Stokes' Theorem is true

Let Σ = a region in the xyz-space, parametrized by a region R in the uv-plane.

$$x = x(u, v) , y = y(u, v) , z = z(u, v)$$

Let $C = \partial R$ = the boundary of R, traversed counterclockwise, parametrized as

$$u = u(t), v = v(t)$$
 , $a \le t \le b$

Then the boundary of Σ is a curve E parametrized as

$$x = x(u(t), v(t)), y = y(u(t), v(t)), z = z(u(t), v(t))$$
, $a < t < b$

Let $\vec{F} = \langle L, M, N \rangle = \text{a vector field on } \Sigma$, and let $\text{curl}(F) = \langle M_z - N_y, -(L_z - N_x), L_y - M_x \rangle$

Then Stokes' Theorem says that

(*)
$$\int \int_{\Sigma} \operatorname{curl}(\vec{F}) \bullet \vec{N} \ dA = \int_{E} \vec{F} \bullet \ d\vec{r}$$

To show this, we will translate both integrals to the uv-plane, and use Green's Theorem!

We will start with the path integral. Using the Chain Rule, we can compute that the curve \vec{r} in xyz-space has velocity vector

$$\vec{r}'(t) = \langle x'(t), y'(t), z'(t) \rangle = \langle x_u u_t + x_v v_t, y_u u_t + y_v v_t, z_u u_t + z_v v_t \rangle$$
, so

$$\int_{E} \vec{F} \bullet dr = \int_{a}^{b} \langle L, M, N \rangle \bullet \langle x_{u}u_{t} + x_{v}v_{t}, y_{u}u_{t} + y_{v}v_{t}, z_{u}u_{t} + z_{v}v_{t} \rangle dt$$

$$= \int_{a}^{b} L \cdot (x_{u}u_{t} + x_{v}v_{t}) + M \cdot (y_{u}u_{t} + y_{v}v_{t}) + N \cdot (z_{u}u_{t} + z_{v}v_{t}) dt$$

$$= \int_{a}^{b} (Lx_{u} + My_{u} + Nz_{u})u_{t} + (Lx_{v} + My_{v} + Nz_{v})v_{t} dt$$

which, from the point of view of the uv-plane, is the integral of the vector field

$$\vec{G} = \langle Lx_u + My_u + Nz_u, Lx_v + My_v + Nz_v \rangle$$

over the curve C. (Technical point: L,M, and N are thought of here as functions of u and v, not of x,y and z. So these really stand for L(x(u,v),y(u,v),z(u,v)), etc.) But since C is the boundary of the region R, traversed counterclockwise, **Green's Theorem** tells us that

$$\int_{C} \vec{G} \bullet d\vec{r} = \int \int_{R} \operatorname{curl}(\vec{G}) dA$$

But, using the Chain Rule,

$$\operatorname{curl}(\vec{G}) = (Lx_{v} + My_{v} + Nz_{v})_{u} - (Lx_{u} + My_{u} + Nz_{u})_{v}$$

$$= (Lx_{v})_{u} + (My_{v})_{u} + (Nz_{v})_{u} - (Lx_{u})_{v} - (My_{u})_{v} - (Nz_{u})_{v}$$

$$= (L_{u}x_{v} + Lx_{vu}) + (M_{u}y_{v} + My_{vu}) + (N_{u}z_{v} + Nz_{vu})$$

$$-(L_{v}x_{u} + Lx_{uv}) - (M_{v}y_{u} + My_{uv}) - (N_{v}z_{u} + Nz_{uv})$$

$$= L_{u}x_{v} - L_{v}x_{u} + M_{u}y_{v} - M_{v}y_{u} + N_{u}z_{v} - N_{v}z_{u}$$

$$+(Lx_{vu} - Lx_{uv}) + (My_{vu} - My_{uv}) + (Nz_{vu} - Nz_{uv})$$

$$= L_{u}x_{v} - L_{v}x_{u} + M_{u}y_{v} - M_{v}y_{u} + N_{u}z_{v} - N_{v}z_{u}$$

because mixed partials are equal. So

$$\int_{E} \vec{F} \bullet dr = \int_{C} \vec{G} \bullet d\vec{r} = \int \int_{R} L_{u}x_{v} - L_{v}x_{u} + M_{u}y_{v} - M_{v}y_{u} + N_{u}z_{v} - N_{v}z_{u} du dv$$

So to show that Stokes' Theorem is true, it is enough to show that

$$\int \int_{\Sigma} \operatorname{curl}(\vec{F}) \bullet \vec{N} \ dA$$

is equal to the integral over R above. But! Using our parametrization of Σ ,

$$\int \int_{\Sigma} \operatorname{curl}(\vec{F}) \bullet \vec{N} \ dA = \int \int_{R} \operatorname{curl}(\vec{F}) \bullet (T_u \times T_v) \ du \ dv$$

and so it is enough to show that

$$\operatorname{curl}(\vec{F}) \bullet (T_u \times T_v) = L_u x_v - L_v x_u + M_u y_v - M_v y_u + N_u z_v - N_v z_u$$
But!

$$\operatorname{curl}(\vec{F}) = \langle N_y - M_z, -(N_x - L_z), M_x - L_y \rangle \text{, and}$$

$$T_u = \langle x_u, y_u, z_u \rangle , T_v = \langle x_v, y_v, z_v \rangle \text{, so } T_u \times T_v = \langle y_u z_v - y_v z_u, -(x_u z_v - x_v z_u), x_u y_v - x_v y_u \rangle$$
and so

$$\begin{aligned} \operatorname{curl}(\vec{F}) \bullet (T_u \times T_v) &= \langle N_y - M_z, -(N_x - L_z), M_x - L_y \rangle \bullet \langle y_u z_v - y_v z_u, -(x_u z_v - x_v z_u), x_u y_v - x_v y_u \rangle \\ &= (N_y - M_z)(y_u z_v - y_v z_u) + (N_x - L_z)(x_u z_v - x_v z_u) + (M_x - L_y)(x_u y_v - x_v y_u) \\ &= N_y y_u z_v - N_y y_v z_u - M_z y_u z_v + M_z y_v z_u + N_x x_u z_v - N_x x_v z_u \\ &- L_z x_u z_v + L_z x_v z_u + M_x x_u y_v - M_x x_v y_u - L_y x_u y_v + L_y x_v y_u \end{aligned} \\ &= (L_z z_u + L_y y_u) x_v + (M_x x_u + M_z z_u) y_v + (N_y y_u + N_x x_u) z_v \\ &- (L_y y_v + L_z z_v) x_u - (M_x x_v + M_z z_v) y_u - (N_x x_v + N_y y_v) z_u \end{aligned} \\ &= (L_y y_u + L_z z_u) x_v + (M_x x_u + M_z z_u) y_v + (N_x x_u + N_y y_u) z_v \\ &+ (L_x x_u x_v + M_y y_u y_v + N_z z_u z_v) \\ &- (L_y y_v + L_z z_v) x_u - (M_x x_v + M_z z_v) y_u - (N_x x_v + N_y y_v) z_u \\ &- (L_x x_u x_v + M_y y_u y_v + N_z z_u z_v) \end{aligned} \\ &= (L_y y_u + L_z z_u) x_v + (M_x x_u + M_z z_u) y_v + (N_x x_u + N_y y_u) z_v \\ &+ (L_x x_u x_v + M_y y_u y_v + N_z z_u z_v) \\ &- (L_y y_v + L_z z_v) x_u - (M_x x_v + M_z z_v) y_u - (N_x x_v + N_y y_v) z_u \\ &- (L_x x_u x_v + M_y y_u y_v + N_z z_u z_v) \end{aligned}$$

$$&= (L_x x_u + L_y y_u + L_z x_u) x_v + (M_x x_u + M_y y_u + M_z x_v) y_u - (N_x x_v + N_y y_v) z_u \\ &- (L_x x_u x_v + M_y y_u y_v + N_z z_u z_v) \end{aligned}$$

$$&= (L_x x_u + L_y y_u + L_z x_u) x_v + (M_x x_u + M_y y_u + M_z x_u) y_v \\ &+ (N_x x_u + N_y y_u + N_z z_u) z_v \\ &- (L_x x_u x_v + M_y y_u + N_z z_u) z_v \\ &- (L_x x_u x_v + M_y y_u + N_z z_u) z_v \\ &- (L_x x_u x_v + N_y y_u + N_z z_u) z_v \\ &- (L_x x_u x_v + N_y y_u + N_z z_u) z_v \\ &- (L_x x_u x_v + N_y y_u + N_z x_u) z_u \\ &= L_u x_v + M_u y_v + N_u z_v - L_v x_u - M_v y_u - N_v z_u \end{aligned}$$

as desired!

Note that we used the Chain Rule again, showing that $L_x x_u + L_y y_u + L_z z_u = L_u$, etc. Which is why Stokes' Theorem is true....
